Communication Theory Lab
Lab assignment – 1

1.

$$f_m = 1000 \text{ Hz}$$

$$f_c = 10 \text{ MHz}$$

$$k_f = 2 \times \pi \times 1000$$

$$A_m = 5$$

$$A_c = 1$$

Message signal:

$$m(t) = A_m \sin(2\pi f_m t)$$

Carrier signal:

$$c(t) = A_c \sin(2\pi f_c t)$$

Modulated signal:

$$F_m = A_c \cos(2\pi f_c t - (k_f A_m \cos(2\pi f_m t)) / (2\pi f_m))$$

- When A_m is positive, modulated signal has higher frequency.
- When A_m is negative, modulated signal has lower frequency.

2.

$$f_m = 1000 \text{ Hz}$$

$$f_c = 10 \text{ MHz}$$

$$k_f = 2 \times \pi \times 5000$$

$$A_m = 1$$

$$A_c = 1$$

Message signal:

$$m(t) = A_m \sin(2\pi f_m t)$$

Carrier signal:

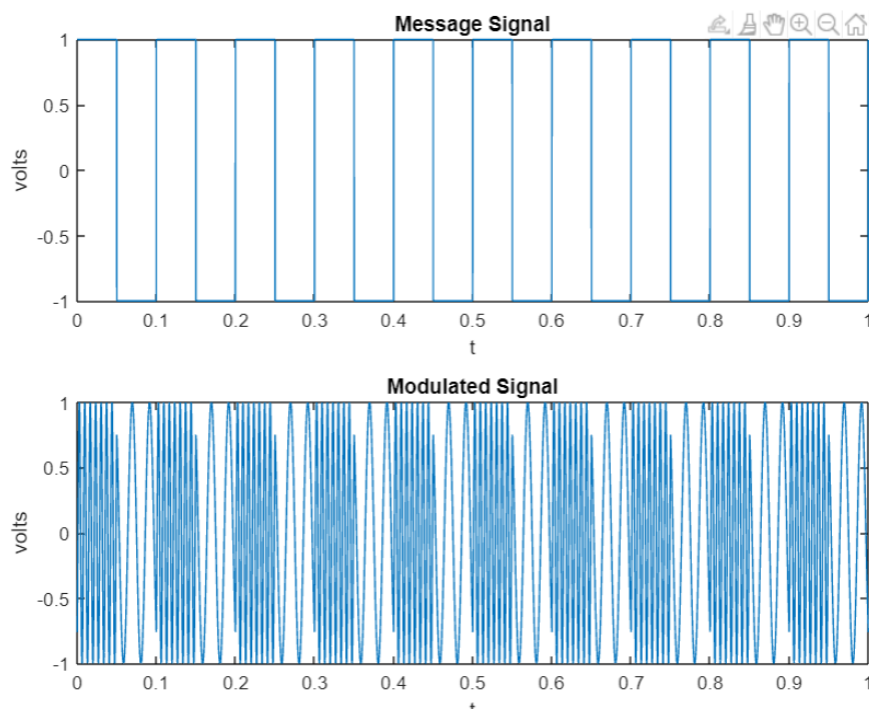

$$c(t) = A_c \sin(2\pi f_c t)$$

Modulated signal

$$F_m = A_c \cos(2\pi f_c t - (k_f A_m \cos(2\pi f_m t)) / (2\pi f_m))$$

- When A_m is positive, modulated signal has higher frequency.
- When A_m is negative, modulated signal has lower frequency.

3.

$$f_m = 10 \text{ Hz}$$

$$f_c = 50 \text{ Hz}$$

$$k_f = 2 \times \pi \times 150$$

$$A_m = 1$$

$$A_c = 1$$

Message Signal

$$m_t = \text{square}(2 \times \pi \times f_m \times t)$$

Carrier Signal

$$c_t = A_c \times \sin(2 \times \pi \times f_c \times t)$$

Modulated Signal

$$F_m = A_c \times \cos(2 \times \pi \times f_c \times t + (k_f / (2 \times \pi \times f_m)) \times \text{sawtooth}(2 \times \pi \times f_m \times t, 0.5))$$

- When A_m is positive, modulated signal has higher frequency.
- When A_m is negative, modulated signal has lower frequency.
- f_c is a lot smaller here than in the previous cases. This makes it easier to observe changes in frequency of FM signal.
